

Question One [15 marks]

A) [5, each]

1. What are the differences between GET and POST methods?

- A GET request is intended to receive information from the server
2- and it often contains a search query or other parameter data

- A POST request is intended to send data to the server, in most cases from HTML form. A form is a part of web pages that lets user to provide data using components.

Post method more secure than GET method because GET method appear the information on the screen above.

2. What is a cookie? Explain briefly.

Cookies are a mechanism for a browser to store data on the client computer.

cookies has:

- | | |
|-----------|-----------|
| 1- name | 4- path |
| 2- value | 5- domain |
| 3- expire | 6- secure |

B) Consider that you are developing a Login functionality for your project, which of the following options would you use and why: PHP Session to support session tracking, or cookies.

It is better to use session because cookies can store the password, so looking more secure for this job.

~ ~~session~~ used

sessions opened when the ~~user~~ ^{user} uses the form and it disappeared after he close the form. "page".

10/15

Question Two [15 marks]

Write PHP/HTML code to address the following business requirements.

- Assume that the client name is sent to the server using cookie, clientName. The cookie should be sent once every 24 hours
- Assume a counter of page access has been stored in a session variable called accessCount. Retrieve this value, and increment the count by 1 and store it back into the session variable.
- If this the first visit, or the cookie has not been sent, you should provide a form to allow the client enter his/her name and reset the counter. Otherwise the following message should be displayed to the client "Dear Fulan, during the last 24 hours this is your 5th visit."

```

• $strRead cookie = $_SERVER['Name'];
• $str2 = $_SERVER['date'];
• $str3 = $_SESSION['accesscount'];

```

```

$str1info = " $strRead :: $str2 :: $str3 ";

```

```

$str4 = $_COOKIE['Another Cookie'];

```

```

strList = explode("::", $str4);

```

Question Three [20 marks]

Assume there is a "school" database at "localhost" host with "test"/"test" username and password. School database contains a "student" table with the following schema student(studentid int, name char(20), gpa number(2,1)). The gpa is a value between 0.0 and 4.0. Write a script that will produces the following output.

Student id	Name	GPA
....		
....		

GPA greater than:

1.5

go

نوع من الفلتر على القيمة 1.5

The output page consists of a table of students, and a form at the bottom.

- The purpose of the form at the bottom is to provide filtering based on the gpa value. Using the figure above, as a result of clicking on the "go" button, user will display students whose gpa greater than 1.5.
- The list should be sorted by the GPA.

```
<?php
< form method="post" action="result.php" >
$ db = mysql_connect ( "localhost", "test", "test" );
$ db_schema = mysql_select_db ( "school", $db );

$ student =
$ s.name =
$ s.gpa =
```
