

Q1: Fill in the Blank (20 mark, 10 questions and 1 bonus question)

Instructions: Fill in the blank with the correct answer, *use a blue ink pen, write clearly, and an unclear answer will be considered a wrong answer.*

1. The HTTP response code 201 indicates that a resource was successfully created on the server.
2. The main difference between GET and POST methods is that GET sends data in the url, while POST sends data in the request body.
3. In the URL `http://example.com/products.php?category=books&sort=price`, the query string is category=books&sort=price.
4. In the URL `https://www.example.com:8080/shop/products.php?id=123#reviews`, the fragment identifier is #reviews.
5. If your current file is at `/website/admin/users/profile.php`, the correct relative path to reference a file at `/website/images/logo.png` is ../website/images/logo.png.
6. The HTML5 semantic element specifically designed for navigation links is nav.
7. When creating a form with multiple checkboxes that should be submitted as an array in PHP, you should name the input fields as colors[] (where colors is the field name).
8. In PHP, to add a new element with value element to the end of an existing array \$a, you write: \$a[] = element;
9. In PHP, to check if an array \$array contains an element with the key 'month', you use the function: isset(\$array['month']).
10. The difference between include and require in PHP is that require produces a fatal error if the file is not found, while include only produces a warning.
11. To access a static property called \$version in a PHP class named Database, you write: Database::\$version

20

Q2: Create static HTML page (25 mark)

Write a full well-formed **static** HTML page named **petra.html** to recreate the webpage shown in the screenshot on the right. **Your HTML code must include:**

Semantic HTML5 Elements

- `<header>` - Contains the page title
- `<nav>` - Navigation menu with links
- `<footer>` - Footer with copyright or contact info
- `<figure>` - Contains the tourism place image
- `<figcaption>` - Caption describing the image

Nested Lists

- Unordered list (`<ul>`) for main items
- Ordered list (`<ol>`) nested inside the unordered list

Accessible Form

The form must include these inputs with proper labels:

- Text input field (for name)
- Email input field
- Date input
- Textarea (for message)
- Checkbox (for subscription)
- Submit and Reset buttons
- Each form input must have a `<label>` element
- Use for attribute in labels linked to input id
- Form must use `method="post"`
- The form must submit to a script "process.php". This assumes the process.php file has been uploaded to the ass1 folder in your domain on the CS host server.

Note:

- Content text does not need to match exactly

Q3: Database with Sortable Table (30 points)

Create a PHP script that displays products from a database in a sortable HTML table.

Database Info:

- Host: localhost, Database: store_db, User: exam_user, Password: exam_pass
- Table: products (id, name, price, stock)

Your script should do the following tasks:

1. Connect to database using PDO (with try-catch)
2. Get products where stock > 0
3. Use prepared statement to execute the query
4. Display results in HTML table with 3 columns: Product Name, Price, Stock
5. Make "Product Name" and "Price" headers clickable links
6. Clicking a header should sort by that column, add the sort parameter and pass the column name using query string in the link.

Q4: Photo Upload with Display Page (25 points)

Create TWO PHP scripts - one to upload photos, one to display them.

Script 1: upload.php (18 points)

do the following tasks:

1. Create a form that submits to itself using global variable `$_SERVER` and add enctype.
2. Form inputs: place title (text) and photo (file)
3. Check if submitted
4. Validate uploaded file: must be jpg, jpeg, png, or gif, and max size: 2MB
5. If valid:
 - Move file to "uploads" folder
 - Rename to: `place_[timestamp].[extension]`
 - Redirect to display.php using `header()`
 - Pass filename and title as GET parameters
6. If invalid: show error message and keep form visible

Script 2: display.php (7 points)

do the following tasks:

1. Get filename and title from `$_GET`
2. Generate a well-formed HTML that displays image inside `<figure>` element and shows title in `<figcaption>`
